

AI CAPSTONE PROJECT PLANNER

Azielon AI Bootcamp — Day 10 Capstone / AI Innovation Expo

Name(s): _____ Team/Track: _____

Fill this out before you write any code, in order. Don't skip ahead — each step only works if the one before it is answered specifically, not broadly.

Step 1: Start With the Big Idea

What's the general problem you care about? (It's OK if this is broad right now.)

The problem is that coding and notepad are in 2 separate apps and dont have AI correction.

Step 2: Narrow It Down (the funnel)

Answer these in order. Each answer should be smaller and more specific than the last.

2a. Pick ONE specific subject

(Not a whole category — just one.)

Your subject:

AI can help fix code and text.

***Gut check:** Could I find or collect 20+ real examples of just this one thing?*

2b. Pick ONE way the user gives you information

(One type of input, given the same way every time.)

Your input type:

Text input or code

***Gut check:** Am I always looking at the same kind of input, in the same format, every time?*

2c. Pick 2–4 SPECIFIC categories/outcomes to tell apart

(Name them exactly — not “what's wrong” or “what it is.”)

1.

Fixed grammar and spelling.

2.

Fixed code

3.

4.

***Gut check:** Can I find or collect 10–15 real examples for EACH one? If not, cut it from the list.*

2d. Pick ONE clear result/action for each category

(One short output each, not a paragraph.)

Your results/actions:

All writing is perfect.
All code is autocompleted and syntax is fixed.

2e. Say what your app will NOT do

(This protects you from scope creep.)

Out of scope:

It won't generate text.

Step 3: The One-Sentence Test

Read this out loud, filled in with your Step 2 answers:

“My app looks at a [input from 2b] of/about [subject from 2a], tells the user which of [categories from 2c] it is, and gives them [result from 2d].”

***Gut check:** Could I say this in one breath? If not, cut a category and try again.*

Your final Problem Statement: “Many _____ struggle with _____ because _____.”

Many coders struggle with coding on cluttered apps and they have to use another app for text and most notepad apps do not have AI.

Step 4: Name Your AI App

App Name:

AIPad

One-line pitch: “[App Name] helps [who] do [what] by [how].”

Alpad helps coders edit and fix text and code by offering AI powered tools

Step 5: INPUT — What goes INTO your app?

Question	Your Answer
What does the user upload/type/click?	They type whatever they want.
What format? (photo, text, number, file)	Text
ONE real example of actual input	He was went to the playground to play.

Step 6: PROCESS — What does the AI/app DO with it?

Question	Your Answer
Steps in order (1, 2, 3...)	Input text or code, if the user turns on AI the app sends the text or code to AI, AI sends it back fixed.
Which part is AI/ML vs. regular code/logic?	The whole app is just code except when the user turns on the AI and it fixes the text and code.
What tool/model/library handles the AI part?	ChatGPT or Claude or Gemini
What could go wrong, and how do you handle it?	Wifi could go out. I can still use regular spell checks.

Step 7: OUTPUT — What comes OUT for the user?

Question	Your Answer
What does the user see/get?	The user get fixed code or text.
ONE real example of output, matching your Step 5 example	He went to the playground to play.
How does the user know it's correct/helpful?	They will read the text and see.

Step 8: How Will You Know It Worked?

Success looks like:

If the text and code comes out well and the user interface is really simple and fast.

One thing you'll test it on, live, on Day 10:

I will type wrong text and code and see it fixed and I will compare UI speed and simplicity to apps like the windows notepad and notepad++.

Full Flow

(Draw it or write it — fill each box with your Step 5–7 examples.)

INPUT	PROCESS	OUTPUT
Text or code	Text or code is sent to AI. Then sent back to the notepad.	The result is perfect text and code.

Quick Gut-Check Questions

Use these anytime you feel stuck or overwhelmed.

- Can I collect real examples for every category I listed? (If no → cut that category)
- Could I explain my whole project in one breath? (If no → it's still too big)
- If I had to demo this LIVE on Day 10 with an example I've never seen before, would it work? (If unsure → narrow further)
- Am I the one deciding what “counts” as each category, and could someone else look at it and agree with me? (If it's fuzzy to you, it'll be fuzzy to your AI)

Keep this page — you'll present directly from it on Day 10.
